

# STOP – no vaccination experiments on children and adolescents!

FOR US, VACCINATIONS ARE PART OF OUR MEDICAL PRECAUTIONS, BUT:  
**WE STRONGLY WARN AGAINST MASS COVID-19 VACCINATIONS, BECAUSE:**

## CHILDREN ARE SIGNIFICANTLY LESS AT RISK FROM COVID-19 THAN ADULTS

Children get rarely severely ill with COVID-19, and even more rarely die from it. Based on evidence, there are no risk groups for more severe COVID-19 courses among them. Only very few of them would benefit from mass vaccination – but millions of them bear the risk.

## CHILDREN DO NOT PLAY A SIGNIFICANT ROLE IN THE SPREAD OF COVID-19

The risk of transmission in schools and day-care centres is very low - even the Robert Koch Institute confirms this. Mass vaccination of children and adolescents can therefore not significantly reduce the spread of COVID-19. Schools and day-care centres can and must be reopened even without child vaccination.

## VACCINATION CHILDREN WILL NOT PROMOTE HERD IMMUNITY

At this stage, it is completely unclear whether COVID-19 vaccines can contribute to sustainable herd immunity at all. Studies that have examined how often vaccinated people still infect others have found this risk reduced by less than half – too little to induce herd immunity through vaccination. Furthermore, we currently do not know how long vaccine immunity lasts at all. We also do not know against which mutations of SARS-CoV-2 the current vaccinations reliably protect.

## CHILDREN ARE PARTICULARLY AT RISK FROM THE SIDE-EFFECTS OF VACCINES

In all previous studies on the COVID-19 vaccines, the severe and most serious side effects mainly affected younger people. Medium- and long-term vaccine consequences cannot yet be assessed, but their risk is particularly severe in children and adolescents. The vaccine studies on children and adolescents that have been started so far are far too small, and their observation period is furthermore far too short to meet the requirements for vaccine safety that are particularly high in children and adolescents.
